Inbound, outbound and internal emails are sent to the mail server; then inbound SPAM is filtered out.

Step 1

The mail server makes a copy of every email. One copy is sent to the appropriate mail user; the other copy is sent to the Defender.

Step 2

Mail to the Defender is indexed, compressed and archived.

Step 3

ArcMail: Complete email archiving and management.
Users can access Defender locally or remotely via web browser or PDA to restore emails deleted from the mail server.

The Defender encrypts all data between the appliance and users to ensure data security.

When emails are restored, the Defender sends a copy back to the mail server, which is then fully accessible and sends daily performance evaluations to administrators.
