

DXOP Email Collections and Distributions

DataExpress supports the collection and distribution of data files as email attachments. The attached files can be sent in clear text or encrypted.

POP3 Collection

The email Collection module can be used to connect to a specified email (POP3) server and pick up emails that have pre-defined identification criteria in their subject fields. Any attachment to the email will be collected by DataExpress as a file. At the operator's discretion, the email Collection module can be configured to send an acknowledgment message to the original sender of the email.

SMTP Distribution

The email Distribution module can be used to attach files to emails and then send them to pre-defined recipients. DataExpress passes the emails to an external SMTP server for delivery. In order to secure the attached file, DataExpress can be configured to automatically encrypt the file via PGP prior to sending.

EMAIL FEATURES

- POP3 FOR COLLECTIONS
- SMTP FOR DISTRIBUTIONS
